

**Amendments to the Claims:**

A listing of the entire set of pending claims (including amendments to the claims, if any) is submitted herewith per 37 CFR 1.121. This listing of claims will replace all prior versions, and listings, of claims in the application.

**Listing of Claims:**

1. (Previously Presented) A multi-view display configured to display two or more views directed to two or more respective viewing zones, comprising:

a display panel, comprising a plurality of imaging units, and a plurality of colour filters, wherein each of said colour filters is associated with one of said imaging units, the colour filters being arranged according to a first pitch and in a first sequence of colours; and

a barrier including a plurality of colour portions comprising colour filter material, the colour portions being arranged according to a second pitch that is substantially equal to twice the first pitch and in a second sequence of colours that corresponds to the first sequence of colours when reversed in order,

wherein the barrier is positioned so that light exits the display panel after passing through one of the colour portions and one of said colour filters and the colour portions of the barrier are configured to cooperate with the colour filters to selectively direct said light passing to the first and second viewing zones; and

wherein translucent spectra of the plurality of colour filters of the display panel are prevented from overlapping translucent spectra of the plurality of colour portions of the barrier.

2. (Previously Presented) The multi-view display according to claim 1, arranged so that said light passes through one of said colour filters before passing through said one colour portion.

3. (Previously Presented) The multi-view display according to claim 1, arranged so that said light passes through said one colour portion before passing through one of said colour filters.
4. (Previously Presented) The multi-view display according to claim 3, wherein the colour filter material of the colour portions is a cholesteric filter material.
5. (Previously Presented) The multi-view display according to claim 1, comprising a light source arranged to illuminate the imaging units of the display panel.
6. (Previously Presented) The multi-view display according to claim 1, wherein barrier is spaced from the colour filters by a separation interval that is less than  $p/0.0781$ , where  $p$  is the first pitch.
7. (Previously Presented) The multi-view display according to claim 1, wherein the colour portions of said barrier are separated from one another by a black matrix.
8. (Previously Presented) The multi-view display according to claim 7, wherein the plurality of colour filters are separated from one another by a black matrix.
9. (Previously Presented) The multi-view display according to claim 8, wherein the barrier is spaced from the colour filters by a separation interval that is less than 0.35 mm.
10. (Previously Presented) The multi-view display according to claim 1, wherein the colour portions of the barrier and the colour filters are aligned so that the light exiting the display panel produces viewing zones that are asymmetrically arranged.
11. (Previously Presented) The multi-view display according to claim 1, wherein said light source comprises a plurality of light emitting diodes, wherein at least two of said light emitting diodes are configured to emit light of first and second colours respectively.

12. (Previously Presented) The multi-view display according to claim 1, wherein said imaging units are light emissive devices.

13. (Previously Presented) A display system comprising:  
a multi-view display according to claim 1; and  
audio output means arranged to output audio signals corresponding to the information displayed in one or more of said viewing zones.

14. (Previously Presented) The multi-view display according to claim 13, arranged to display information in an automotive vehicle.

15. (Previously Presented) Use of a multi-view display according to claim 13 to display different information in different ones of said viewing zones.

16. (Previously Presented) A method of manufacturing a multi-view display according to claim 2, comprising:

providing said plurality of colour portions on a light transmissive substrate;  
placing a sheet of light transmissive material over said plurality of colour portions; and  
providing the plurality of colour filters of the display panel on said sheet of light transmissive material.

17. (Previously Presented) A method of manufacturing a multi-view display according to claim 3, comprising:

providing said plurality of colour portions on a light transmissive substrate;  
placing a sheet of light transmissive material over said plurality of colour portions; and

providing means configured to control said imaging units on said sheet of light transmissive material.

18. (Withdrawn) A multi-view display (49) comprising: a display panel (14), comprising a plurality of imaging units (32) configured with a first pitch; a light source (15) arranged to illuminate the display panel; and a lenticular screen (30) arranged to focus light emitted by the light source to create images of light lines at said plurality of imaging units, the lenticular screen comprising a plurality of lenses (30a, 30b, 30c) configured with a second pitch; wherein said second pitch is substantially equal to an integer multiple of said first pitch, so that said lenses (30a, 30b, 30c) create images on two of said imaging units (32a, 32f) that are spaced apart from one another and adjacent imaging units (32a, 32b) are illuminated by images created by different lenses (30a, 30b).

19. (Withdrawn) A multi-view display (49) according to claim 18, wherein the light source (35) is arranged to generate said light lines at a third pitch, the third pitch being substantially equal to said second pitch.

20. (Withdrawn) A multi-view display (49) according to claim 19, wherein the light source (35) is arranged to generate the light lines at positions aligned with boundaries between the lenses (30a, 30b, 30c).

21. (Withdrawn) A multi-view display (49) comprising: a display panel (14), comprising a plurality of imaging units (32) configured with a first pitch; a light source (15) arranged to generate a plurality of light lines at a plurality of positions arranged with a second pitch; and a lenticular screen (30) arranged to focus light emitted by the light source to create images of light lines at said plurality of imaging units, the lenticular screen comprising a plurality of lenses (30a, 30b, 30c) configured with a third pitch that is substantially equal to the second pitch and arranged so that boundaries between adjacent lenses (30a, 30b, 30c) are aligned with the positions at which the light lines are generated; wherein said second pitch is substantially equal to an integer multiple of said first pitch, so that said lenses (30a, 30b, 30c) create images on two of said imaging units (32a, 32f) that are spaced apart from one another

and adjacent imaging units (32*a*, 32*b*) are illuminated by images created by different lenses (30*a*, 30*b*).

22. (Withdrawn) A multi-view display (49) according to claim 18, comprising a scatterer (36) arranged to scatter light output by the display panel (14).

23. (Withdrawn) A multi-view display (49) according to claim 22, said scatterer (36) is a controlled scatter having a predetermined scattering profile.

24. (Withdrawn) A multi-view display (49) according to claim 22, wherein said scatterer (36) has a scattering surface comprising periodic structural features (39*a*, 39*b*).

25. (Withdrawn) A multi-view display (49) according claim 19, comprising: a switchable diffuser (40); and mode switching means (41, 42) configured to switch said diffuser between a diffusive state and a light transmissive state; wherein said diffuser is positioned between the light source (35) and imaging units (32) so that, when the diffuser is in its light transmissive state, the light lines are imaged at the imaging units (32) and, when the diffuser is in its diffusive state, the imaging units (32) are provided with substantially uniform illumination.

26. (Withdrawn) A multi-view display (49) according to claim 25, wherein said mode switching means (41, 42) are configured to switch the diffuser (40) between said states by applying and removing an electric field thereto.

27. (Withdrawn) A display system comprising: a multi-view display (49) according to claim 18; and audio output means (55) arranged to output audio signals corresponding to the information displayed in one or more of said viewing zones (23, 24).

28. (Withdrawn) A display (49) according to claim 18, configured to display information in an automotive vehicle (53).

29. (Withdrawn) Use of a display (49) according to claim 18 to display different information

in different ones of said viewing zones (23, 24).

30. (Withdrawn) A multi-view display (49) comprising: a display panel (14), comprising a first plurality of imaging units (32a) arranged to display a first view to a first viewing zone (23) and a plurality of second imaging units (32b) arranged to display a second view to a second viewing zone (24), said first imaging units and second imaging units being separated by a plurality of third imaging units (32c); and an illumination arrangement (15, 43, 35) configured to illuminate the display panel (14) with a plurality of light lines; the display being arranged such that said third imaging units are not used to display information when said first and second views are displayed.

31. (Withdrawn) A multi-view display (49) according to claim 30, wherein said third imaging units (32c) are switched off when said first and second views are displayed.

32. (Withdrawn) A multi-view display according to claim 30, wherein each of said first, second and third pluralities of imaging units (32a, 32b, 32c) are arranged in columns and form part of a two dimensional array of imaging units (32).

33. (Withdrawn) A multi-view display according to claim 32, wherein said plurality of first imaging units comprises imaging units (32) arranged in adjacent columns (32a, 32b) of the display panel (14).

34. (Withdrawn) A multi-view display according to claim 33, wherein said plurality of second imaging units comprises imaging units (32) arranged in adjacent columns (32c, 32d) of the display panel (14).

35. (Withdrawn) A multi-view display according to claim 32, wherein said first, second and third pluralities of imaging units (32a, 32b, 32c) are arranged as a periodic sequence of columns in said array.

36. (Withdrawn) A multi-view display according to claim 32, wherein the display panel (14)

comprises a plurality of colour filters (47) arranged as a two-dimensional array.

37. (Withdrawn) A multi-view display (49) according to claim 32, wherein said display panel (14) comprises a plurality of colour filters (47) based on at least four primary colours.

38. (Withdrawn) A multi-view display (49) according to claim 30, comprising: a light source (15); and a barrier (43, 48) including a plurality of light transmissive portions (44) arranged at a given pitch, located between the light source and the display panel (14); and is arranged so that the display panel is illuminated by a plurality of light lines.

39. (Withdrawn) A multi-view display (49) according to claim 30, comprising a barrier (48) including a plurality of light transmissive portions, to selectively admit light, said light transmissive portions being arranged at a first pitch, the barrier (48) being positioned so that light emerging from the imaging units (32) is incident thereon.

40. (Withdrawn) A multi-view display (49) according to claim 38, wherein said barrier (48) is a switchable device that can be switched between a selectively transmissive mode, in which the barrier selectively admits light, and a light transmissive mode, in which the barrier (48) is substantially light transmissive in order to provide uniform illumination for the display panel (14).

41. (Withdrawn) A multi-view display (49) according to claim 38, wherein said barrier (48) is a switchable device that can be operated in a first mode, in which the light transmissive portions are arranged with the first pitch, and a second mode, in which the light transmissive portions are arranged with a second pitch.

42. (Withdrawn) A multi-view display (49) according to claim 40, wherein said barrier (48) is a liquid crystal cell.

43. (Withdrawn) A multi-view display (49) according to claim 38, wherein said display panel (14) comprises a plurality of colour filters (47) and wherein said barrier (43, 48 ) and said

plurality of colour filters are arranged in a non-parallel configuration.

44. (Withdrawn) A multi-view display (49) according to claim 38, wherein the illumination arrangement (15, 46) comprises a light source (15) arranged to generate light lines and a lenticular screen (46) arranged to image the light lines within the display panel (14).

45. (Withdrawn) A multi-view display (56) according to claim 30, wherein light transmissive portions of the barrier (43, 48) and said third imaging units (32c, 32f) are aligned so that the light output by display panel (14) creates the viewing zones (23, 24) in an asymmetrical arrangement.

46. (Withdrawn) A display system comprising: a multi-view display (49, 56) according to claim 30; and audio output means (55) arranged to output audio signals corresponding to the information displayed in one or more of said viewing zones (23, 24).

47. (Withdrawn) A multi-view display (49, 56) according to claim 30 or a display system according to claim 46, arranged to display information in an automotive vehicle (53).

48. (Withdrawn) Use of a multi-view display (49) according to claim 30 or a display system according to claim 47 to display different information in respective ones of said viewing zones (23, 24).
